

Determine the Right Merge or Join Transformer

No SQL

Recommended

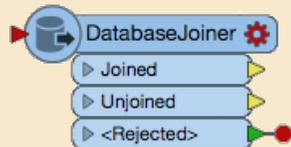

Joins features by combining the attributes/geometry of features based on common attribute values, like a SQL join operation.

SQL terminology, better performance, 2018+

Join to an **INTERNAL** data source
(Data already in workspace)

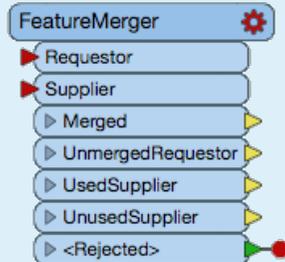

Start Here

Join to an **EXTERNAL** data source
(Data not in workspace)

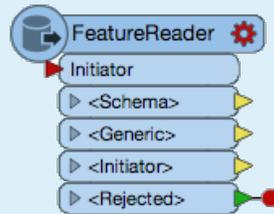

Joins attributes from an external table to incoming features as they are being processed through a translation.

Many small queries, 1:Many, uses look up tables

Copies and merges the attributes/geometry from one feature (or multiple features) onto another feature (or multiple features). When working with lists, try the ListBasedFeatureMerger

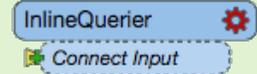

Predecessor to the FeatureJoiner

Reads features from any FME-supported format. The features read can be constrained by specifying a WHERE clause or a spatial filter for formats that support them.

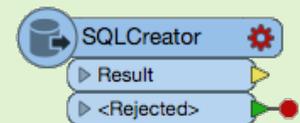

Joins any format, bulk queries, spatial joins

SQL

Executes SQL queries against a temporary database consisting of tables created from incoming features, returning the results as new features.

Robust SQL functionality

Performs SQL queries against a database. Either can be used interchangeably the only different is the SQLCreator works at the beginning of the workflow.

Reads in data, query can be made against other sources
